

B. normalised: where E2 and E3 are read

turn (one tick per environment action)

action accepted

action failed outright

Scatter plot showing the difference in R-squared values between quadratic and linear models (E4: R2(quadratic) - R2(linear)) versus the number of billed model calls E4 was fitted over (battery E4 support 'turns').

Legend:

- bare_cc, scored (70)
- other arm, scored (0)

The plot shows that the difference in R-squared values generally increases with the number of billed model calls for the 'bare_cc' group, while it generally decreases for the 'other arm' group.

ABSENT, NOT ZERO -- 29 of 99 drawn runs
carry no E4:
8 run(s):
fewer than five turns; a quadratic needs
21 run(s):
no battery run at all; battery v2 scores t
